Here is the statement provided by Sanford's Superintendent:

Norman reviewed the old monthly sheets and found that the last time we truly used it was October of 1999. We may have pumped into the system for a day or two here and there either for sampling purposes or possibly even to help out on a hot day, but the last time we can find that we ran it as a source of supply into the system is October 1999. That makes sense, as that is the year that our Country Club 2 well came online. We probably did not need to use it to meet demand after that.

The current status is as a backup source of supply for use only in emergency situations.

Hi Roger

Just checking my facts-

Can you confirm that Sanford ME closed the well with elevated PFOA/PFOS and that the other wells are not contaminated. When did that happen?

Just need to report out on steps taken by utilities.

Have a good day

Jane
